Classroom Usage Forecasting with ARIMA

Predicting Next-Hour Room Electricity Draw from Wi-Fi Occupancy Sensor Data

This notebook demonstrates:

- Wi-Fi occupancy sensor data collection and processing
- ARIMA time series modeling for electricity consumption forecasting
- Interactive dashboard with confidence intervals

1. Simulate Wi-Fi Occupancy Sensor Data

Generate realistic classroom occupancy data from Wi-Fi logs (number of connected devices) over the past 7 days.

```
def generate_wifi_occupancy_data(days=7, room_name="Classroom_A"):
    """
    Generate realistic Wi-Fi occupancy sensor data for a classroom

    Parameters:
    - days: Number of days of historical data
    - room_name: Name of the classroom

    Returns:
    - DataFrame with hourly occupancy and electricity consumption
    """
    # Generate datetime range (hourly data)
    end_time = datetime.now()
    start_time = end_time - timedelta(days=days)
    timestamps = pd.date_range(start=start_time, end=end_time, freq='h')

    data = []

    for ts in timestamps:
        hour = ts.hour
        day_of_week = ts.dayofweek  # Monday=0, Sunday=6

        # Classroom schedule pattern (weekdays 8 AM - 6 PM)
        if day_of_week < 5:  # Weekday
            if 8 <= hour <= 18:  # Class hours
                # Peak occupancy during class hours
                base_occupancy = np.random.randint(15, 45)

                # Lunch break (12 PM - 1 PM) - lower occupancy
                if hour == 12:
                    base_occupancy = np.random.randint(5, 15)

                # Peak hours (10 AM - 11 AM, 2 PM - 4 PM)
                if hour in [10, 11, 14, 15, 16]:

```

```
 Initial visualization complete!
```

3. Time Series Analysis - Stationarity Check

Check if the electricity consumption time series is stationary using the Augmented Dickey-Fuller test.

```
def check_stationarity(timeseries, title='Time Series'):
    """
    Perform Augmented Dickey-Fuller test to check stationarity
    """
    print(f"\n{'='*70}")
    print(f"STATIONARITY TEST: {title}")
    print('='*70)

    # Augmented Dickey-Fuller test
    result = adfuller(timeseries.dropna(), autolag='AIC')
```

```
    print(f'\nAugmented Dickey-Fuller Test Results:')
    print(f'  ADF Statistic: {result[0]:.6f}')
    print(f'  p-value: {result[1]:.6f}')
    print(f'  Critical Values:')
    for key, value in result[4].items():
        print(f'    {key}: {value:.3f}')

    # Interpretation
    if result[1] <= 0.05:
        print(f'\n Result: Series is STATIONARY (p-value \u2264 0.05)')
        print(f'   \u2192 We can reject the null hypothesis')
        print(f'   \u2192 The series does not have a unit root')
    else:
        print(f'\n  Result: Series is NON-STATIONARY (p-value > 0.05)')
        print(f'   \u2192 We cannot reject the null hypothesis')
        print(f'   \u2192 Differencing may be required for ARIMA')

    return result[1] <= 0.05

# Check stationarity of electricity consumption
is_stationary = check_stationarity(df_sensor['electricity_kwh'],
                                   title='Electricity Consumption (kWh)')
```

```
======================================================================
STATIONARITY TEST: Electricity Consumption (kWh)
======================================================================

Augmented Dickey-Fuller Test Results:
  ADF Statistic: -5.311805
  p-value: 0.000005
  Critical Values:
    1%: -3.472
    5%: -2.880
    10%: -2.576

 Result: Series is STATIONARY (p-value ≤ 0.05)
   → We can reject the null hypothesis
   → The series does not have a unit root
```

4. ACF and PACF Analysis

Analyze Autocorrelation Function (ACF) and Partial Autocorrelation Function (PACF) to determine ARIMA parameters.

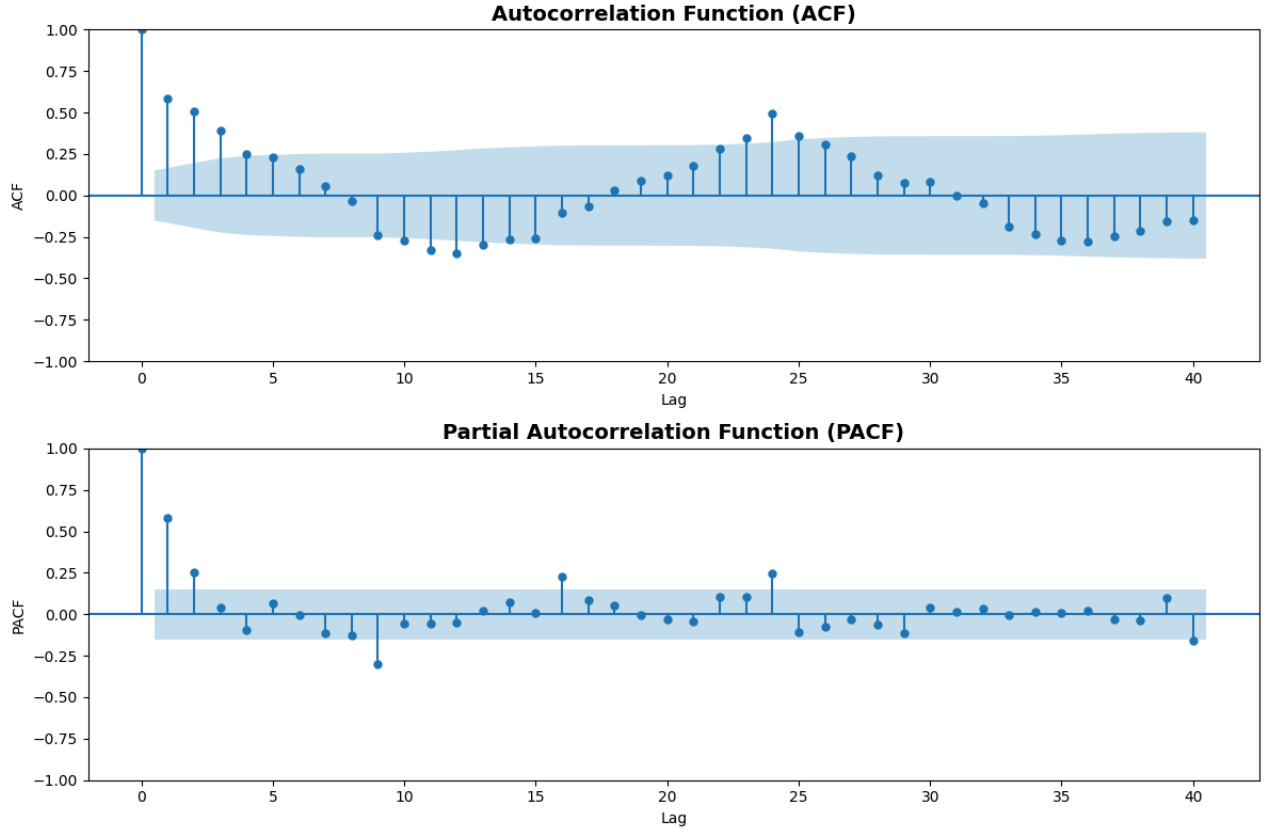
```
# Create ACF and PACF plots
fig, axes = plt.subplots(2, 1, figsize=(12, 8))

# ACF plot
plot_acf(df_sensor['electricity_kwh'].dropna(), lags=40, ax=axes[0])
axes[0].set_title('Autocorrelation Function (ACF)', fontsize=14, fontweight='bold')
axes[0].set_xlabel('Lag')
axes[0].set_ylabel('ACF')

# PACF plot
plot_pacf(df_sensor['electricity_kwh'].dropna(), lags=40, ax=axes[1])
axes[1].set_title('Partial Autocorrelation Function (PACF)', fontsize=14, fontweight='bold')
axes[1].set_xlabel('Lag')
axes[1].set_ylabel('PACF')

plt.tight_layout()
plt.show()

print("\n ACF and PACF plots generated!")
print("\n Interpreting the plots:")
print("   - ACF: Shows correlation between time series and its lagged values")
print("   - PACF: Shows correlation after removing effects of intermediate lags")
print("   - These help determine the p (AR) and q (MA) parameters for ARIMA")
```



```
ACF and PACF plots generated!

Interpreting the plots:
  - ACF: Shows correlation between time series and its lagged values
  - PACF: Shows correlation after removing effects of intermediate lags
  - These help determine the p (AR) and q (MA) parameters for ARIMA
```

5. Train ARIMA Model

Train an ARIMA model to predict next-hour electricity consumption. We'll use the last 24 hours for testing.

```
# Prepare data for ARIMA
df_model = df_sensor.copy()
df_model.set_index('timestamp', inplace=True)

# Split into train and test sets (last 24 hours for testing)
train_size = len(df_model) - 24
train_data = df_model['electricity_kwh'][:train_size]
test_data = df_model['electricity_kwh'][train_size:]

print(f" Data Split:")
print(f"   Training set: {len(train_data)} hours")
print(f"   Test set: {len(test_data)} hours")
print(f"   Train date range: {train_data.index[0]} to {train_data.index[-1]}")
print(f"   Test date range: {test_data.index[0]} to {test_data.index[-1]}")

# Train ARIMA model
# ARIMA(p, d, q) parameters:
# p: order of autoregressive part (AR)
# d: degree of differencing (I)
# q: order of moving average part (MA)

print(f"\n Training ARIMA model...")
print(f"   Testing ARIMA(2,1,2) configuration...")

# Fit ARIMA model
model = ARIMA(train_data, order=(2, 1, 2))
```

```
fitted_model = model.fit()

print(f"\n ARIMA model trained successfully!")
print(f"\n{'='*70}")
print("MODEL SUMMARY")
print('='*70)
print(fitted_model.summary())
```

```
 Data Split:
   Training set: 145 hours

6. Make Predictions with Confidence Intervals

Generate predictions for the test period (next 24 hours) with 95% confidence intervals.

```
# Generate predictions with confidence intervals
n_forecast = len(test_data)
forecast_result = fitted_model.get_forecast(steps=n_forecast)

# Extract predictions and confidence intervals
predictions = forecast_result.predicted_mean
confidence_intervals = forecast_result.conf_int(alpha=0.05)  # 95% confidence interval

# Create prediction dataframe
predictions_df = pd.DataFrame({
    'timestamp': test_data.index,
    'actual': test_data.values,
    'predicted': predictions.values,
    'lower_ci': confidence_intervals.iloc[:, 0].values,
    'upper_ci': confidence_intervals.iloc[:, 1].values
})

print(" Predictions generated!")
print(f"\n{'='*70}")
```

```
print("FORECAST RESULTS (First 10 hours)")
print('='*70)
print(predictions_df.head(10).to_string(index=False))

# Calculate prediction metrics
mae = mean_absolute_error(test_data, predictions)
mse = mean_squared_error(test_data, predictions)
rmse = np.sqrt(mse)
mape = np.mean(np.abs((test_data - predictions) / test_data)) * 100

print(f"\n{'='*70}")
print("MODEL PERFORMANCE METRICS")
print('='*70)
print(f"Mean Absolute Error (MAE): {mae:.4f} kWh")
print(f"Root Mean Square Error (RMSE): {rmse:.4f} kWh")
print(f"Mean Absolute Percentage Error (MAPE): {mape:.2f}%")
print(f"\n Model achieves {100-mape:.2f}% accuracy on test data")
```

```
 Predictions generated!

 Model achieves -22.34% accuracy on test data
```

7. Next-Hour Prediction

Make a single prediction for the very next hour with confidence interval.

```
# Retrain model on all available data for next-hour prediction
full_model = ARIMA(df_model['electricity_kwh'], order=(2, 1, 2))
full_fitted = full_model.fit()

# Predict next hour
next_hour_forecast = full_fitted.get_forecast(steps=1)
next_hour_pred = next_hour_forecast.predicted_mean.values[0]
next_hour_ci = next_hour_forecast.conf_int(alpha=0.05)

next_hour_lower = next_hour_ci.iloc[0, 0]
next_hour_upper = next_hour_ci.iloc[0, 1]

# Get timestamp for next hour
last_timestamp = df_model.index[-1]
next_timestamp = last_timestamp + timedelta(hours=1)

print(f"\n{'='*70}")
print("NEXT-HOUR ELECTRICITY CONSUMPTION FORECAST")
print('='*70)
print(f"\n Current Time: {last_timestamp}")
print(f" Forecast Time: {next_timestamp}")
print(f"\n PREDICTION:")
print(f"   Expected Consumption: {next_hour_pred:.3f} kWh")
print(f"   95% Confidence Interval: [{next_hour_lower:.3f}, {next_hour_upper:.3f}] kWh")
print(f"   Uncertainty Range: \u00b1{(next_hour_upper - next_hour_lower)/2:.3f} kWh")
print(f"\n Interpretation:")
print(f"   We are 95% confident that the electricity consumption in the next hour")
print(f"   will be between {next_hour_lower:.3f} and {next_hour_upper:.3f} kWh")
```

======================================================================
NEXT-HOUR ELECTRICITY CONSUMPTION FORECAST
======================================================================

 Current Time: 2026-02-19 05:35:59.683890
 Forecast Time: 2026-02-19 06:35:59.683890

 PREDICTION:
   Expected Consumption: 2.018 kWh
   95% Confidence Interval: [-2.104, 6.140] kWh
   Uncertainty Range: ±4.122 kWh

 Interpretation:
   We are 95% confident that the electricity consumption in the next hour
   will be between -2.104 and 6.140 kWh
```

8. Interactive Dashboard with Confidence Intervals

Create a comprehensive dashboard showing historical data, predictions, and confidence intervals.

```
# Create comprehensive dashboard
fig = make_subplots(
    rows=3, cols=2,
    subplot_titles=(
        'Full Time Series - Training & Test Data',
        'Test Period: Actual vs Predicted (24h)',
        'Prediction Error Distribution',
        'Confidence Intervals Coverage',
        'Next-Hour Forecast with Confidence Interval',
        'Occupancy vs Electricity Correlation'
    ),
    specs=[
        [{"colspan": 2}, None],
        [{"type": "xy"}, {"type": "xy"}],
        [{"type": "xy"}, {"type": "xy"}]
    ],
    vertical_spacing=0.12,
    horizontal_spacing=0.12,
    row_heights=[0.3, 0.35, 0.35]
)

# 1. Full time series with train/test split
fig.add_trace(
    go.Scatter(
        x=train_data.index,
