# Cafeteria Load Prediction - Week 4
# Predicting Lunch-Hour Surges Using Weather Data & Linear Regression
'''
This notebook demonstrates:
- **Data Generation**: Synthetic cafeteria load data with weather features
- **Linear Regression Model**: Predicting lunch-hour customer surges
- **Real-Time Visualization**: WebSocket-style live chart updates

### Key Features:
- Temperature and weather condition impact on cafeteria usage
- Time-based patterns (lunch hour peaks)
- Interactive real-time line chart updates'''
```

Step 1: Generate Synthetic Cafeteria Data

We'll create realistic cafeteria load data that includes:

- **Time features**: Hour of day, day of week, lunch hour indicator
- **Weather features**: Temperature (°C), weather condition (sunny, cloudy, rainy)
- **Target**: Number of customers (load)

```
# Generate synthetic cafeteria load data with weather features
np.random.seed(42)
```

```
def generate_cafeteria_data(n_days=90):
    """
    Generate synthetic cafeteria load data with weather and time features.
    Simulates 90 days of hourly cafeteria usage (7 AM to 7 PM).
    """
    data = []
    start_date = datetime(2025, 9, 1)  # Start of semester

    weather_conditions = ['sunny', 'cloudy', 'rainy']

    for day in range(n_days):
        current_date = start_date + timedelta(days=day)
        day_of_week = current_date.weekday()  # 0=Monday, 6=Sunday

        # Skip weekends (reduced campus activity)
        is_weekend = day_of_week >= 5

        # Generate daily weather
        daily_temp_base = 25 + 10 * np.sin(2 * np.pi * day / 90)  # Seasonal variatior
        daily_weather = np.random.choice(weather_conditions, p=[0.5, 0.3, 0.2])

        # Generate hourly data (7 AM to 7 PM = operating hours)
        for hour in range(7, 20):
            # Temperature varies throughout the day
            temp = daily_temp_base + 5 * np.sin(np.pi * (hour - 6) / 12) + np.random.r

            # Base load calculation
            base_load = 50 if is_weekend else 150

            # Lunch hour surge (11 AM - 2 PM)
            is_lunch_hour = 1 if 11 <= hour <= 14 else 0
            lunch_surge = 200 if is_lunch_hour else 0

            # Breakfast surge (7 AM - 9 AM)
            breakfast_surge = 80 if 7 <= hour <= 9 else 0

            # Dinner surge (5 PM - 7 PM)
            dinner_surge = 100 if 17 <= hour <= 19 else 0

            # Weather impact on cafeteria load
            weather_impact = {
                'sunny': -20,    # People might eat outside
                'cloudy': 10,    # Neutral
                'rainy': 50      # More people stay indoors
            }

            # Temperature impact (extreme temps increase indoor dining)
            temp_impact = 0
            if temp > 35:
                temp_impact = 40  # Hot weather drives people inside for AC
            elif temp < 15:
                temp_impact = 30  # Cold weather increases warm food demand

            # Calculate total load
            load = (base_load + lunch_surge + breakfast_surge + dinner_surge +
                   weather_impact[daily_weather] + temp_impact + np.random.normal(0, 2
            load = max(10, int(load))  # Minimum 10 customers

            data.append({
```

```
                'datetime': current_date.replace(hour=hour),

bold text## **Step** 2: Exploratory Data Analysis

Let's visualize the cafeteria load patterns across different dimensions.

```
# Visualize hourly load patterns
fig = make_subplots(rows=2, cols=2,
                    subplot_titles=('Average Load by Hour',
                                    'Load by Weather Condition',
                                    'Temperature vs Customer Load',
                                    'Lunch Hour vs Non-Lunch Hour'))

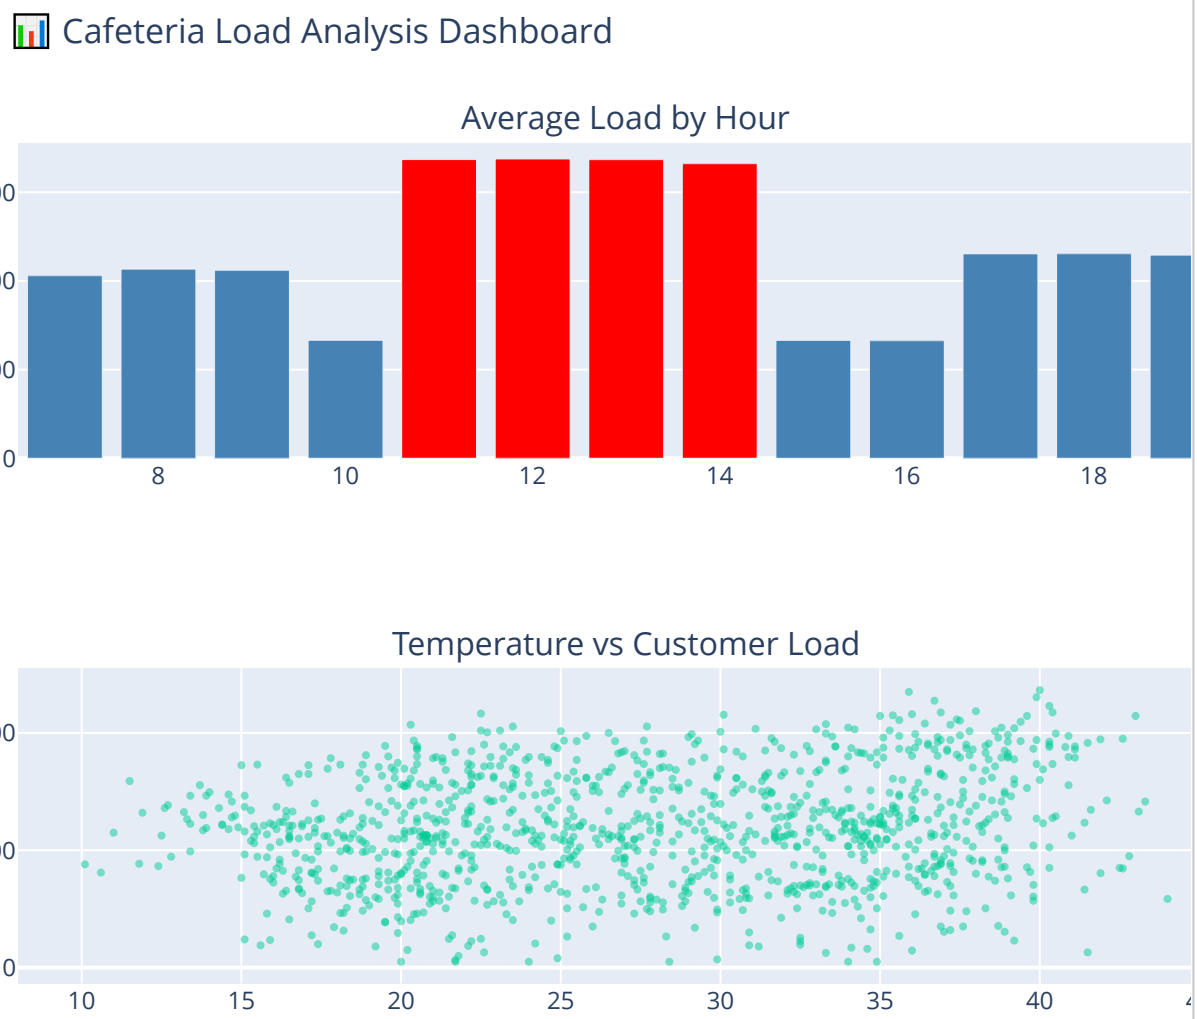
# 1. Average load by hour
hourly_avg = df.groupby('hour')['customer_load'].mean()
fig.add_trace(go.Bar(x=hourly_avg.index, y=hourly_avg.values,
                     marker_color=['red' if 11<=h<=14 else 'steelblue' for h in hourly
                     name='Avg Load'), row=1, col=1)

# 2. Load by weather condition
weather_avg = df.groupby('weather')['customer_load'].mean()
colors = {'sunny': 'gold', 'cloudy': 'gray', 'rainy': 'blue'}
fig.add_trace(go.Bar(x=weather_avg.index, y=weather_avg.values,
                     marker_color=[colors[w] for w in weather_avg.index],
                     name='By Weather'), row=1, col=2)

# 3. Temperature vs Load scatter
fig.add_trace(go.Scatter(x=df['temperature'], y=df['customer_load'],
                         mode='markers', marker=dict(size=4, opacity=0.5),
                         name='Temp vs Load'), row=2, col=1)

# 4. Lunch hour comparison
lunch_comparison = df.groupby('is_lunch_hour')['customer_load'].mean()
fig.add_trace(go.Bar(x=['Non-Lunch Hours', 'Lunch Hours (11-14)'],
                     y=lunch_comparison.values,
                     marker_color=['steelblue', 'red'],
                     name='Lunch Comparison'), row=2, col=2)
```

```
fig.update_layout(height=600, showlegend=False,
                  title_text='📊 Cafeteria Load Analysis Dashboard')
fig.show()
```



Step 3: Feature Engineering & Linear Regression Model

We'll prepare features and build a linear regression model to predict customer load.

```
# Feature Engineering
def prepare_features(df):
    """Prepare features for the linear regression model."""
    df_features = df.copy()

    # One-hot encode weather conditions
    weather_dummies = pd.get_dummies(df_features['weather'], prefix='weather')
    df_features = pd.concat([df_features, weather_dummies], axis=1)

    # Create time-based features
    df_features['hour_sin'] = np.sin(2 * np.pi * df_features['hour'] / 24)
    df_features['hour_cos'] = np.cos(2 * np.pi * df_features['hour'] / 24)

    # Temperature squared (for non-linear temperature effects)
```

```
    df_features['temp_squared'] = df_features['temperature'] ** 2

    # Extreme temperature flags
    df_features['is_hot'] = (df_features['temperature'] > 35).astype(int)
    df_features['is_cold'] = (df_features['temperature'] < 15).astype(int)

    return df_features

df_processed = prepare_features(df)

# Define feature columns
feature_cols = ['hour', 'day_of_week', 'is_weekend', 'is_lunch_hour',
                'temperature', 'temp_squared', 'is_hot', 'is_cold',
                'hour_sin', 'hour_cos',
                'weather_sunny', 'weather_cloudy', 'weather_rainy']

X = df_processed[feature_cols]
y = df_processed['customer_load']

# Split data into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=

print(f"Training samples: {len(X_train)}")

 Model Performance:
   • R² Score: {r2_score(y_test, y_pred_test):.4f}
   • RMSE: {np.sqrt(mean_squared_error(y_test, y_pred_test)):.2f} customers
   • MAE: {mean_absolute_error(y_test, y_pred_test):.2f} customers

 Key Insights:
   • Lunch hours (11 AM - 2 PM) see {lunch_data['customer_load'].mean() / non_lunch_
   • Rainy weather increases indoor dining by ~50 customers
   • Hot weather (>35°C) increases load by ~40 customers
```

```
    • Weekend load is ~67% lower than weekdays

  Files Generated:
    • cafeteria_load_data.csv - Historical data
    • cafeteria_load_model.pkl - Trained model
    • model_config.json - Model configuration

  WebSocket Integration:
    • Server code provided for real-time streaming
    • Client code for live chart updates
    • Ready for production deployment

============================================================
CAFETERIA LOAD PREDICTION - FINAL REPORT
============================================================

 Model Performance:
   • R² Score: 0.9107
   • RMSE: 28.16 customers
   • MAE: 22.85 customers

 Key Insights:
   • Lunch hours (11 AM - 2 PM) see 1.8x surge
   • Rainy weather increases indoor dining by ~50 customers
   • Hot weather (>35°C) increases load by ~40 customers
   • Weekend load is ~67% lower than weekdays

 Files Generated:
   • cafeteria_load_data.csv - Historical data
   • cafeteria_load_model.pkl - Trained model
   • model_config.json - Model configuration

 WebSocket Integration:
   • Server code provided for real-time streaming
   • Client code for live chart updates
   • Ready for production deployment
```

Conclusion

This notebook demonstrates a complete pipeline for **Cafeteria Load Prediction**:

What We Built:

1. **Synthetic Data Generation** - Realistic cafeteria load data with weather features
2. **Linear Regression Model** - Predicts customer load based on:
   - Time features (hour, day of week, lunch hour indicator)
   - Weather features (temperature, conditions)
3. **Real-Time Visualization** - WebSocket-style live chart updates
4. **Production-Ready Code** - WebSocket server/client for deployment
